Handle Hidden (Disappeared) Elements

Sometimes UI elements such as **dropdowns**, **menus**, **tooltips**, or **auto-suggestions** disappear as soon as they lose focus, making them difficult to inspect in the browser. The following approaches can help you inspect such hidden elements.

Option 1: Pause JavaScript Execution

This method temporarily freezes the webpage, allowing you to inspect hidden elements.

Steps

1. Open the webpage in your browser.
2. Open **Developer Tools** (F12 or Ctrl + Shift + I).
3. Go to the **Sources** tab.
4. Open the dropdown, menu, or other hidden element on the webpage.
5. Immediately click the **Pause Script Execution** button (**II**) or press **F8**.
6. The webpage will freeze, keeping the hidden element visible.
7. Switch to the **Elements** tab.
8. Inspect the required element.
9. After completing the inspection, click the **Resume Script Execution** button or press **F8** again.

Note: This approach works well for inspecting dropdowns, context menus, auto-suggestions, and other elements that disappear when focus is lost.

Option 2: Emulate a Focused Page

This method forces the browser to keep the page focused, preventing hidden elements from disappearing.

Steps

1. Open the webpage.
2. Open **Developer Tools** (F12 or Ctrl + Shift + I).
3. Open the **Command Menu**:
    - **Windows/Linux:** Ctrl + Shift + P
    - **Mac:** Cmd + Shift + P

4. In the Command Menu, type:

5. Emulate a focused page

6. Press **Enter**.
7. The page will remain focused, allowing you to inspect hidden elements without them disappearing.
8. Open the dropdown or menu and inspect it normally using the **Elements** tab.

Tip: This is one of the easiest and most reliable methods for inspecting elements that disappear when they lose focus.

Summary

Method	Best Use Case
Pause Script Execution (F8)	Freezes the page instantly, allowing inspection of disappearing elements.
Emulate a Focused Page	Keeps the page focused so dropdowns, menus, and tooltips remain visible during inspection.
